

My mad theory to find Free-floating Unknown probes

When the UA = Unknown artefact was first discovered they were in “Fed Convoys” as the UP is now.

Later an Xbox player found a free-floating UA in the HR 1185 system near Merope. They were RARE and took several hours to spawn. But they were found and allowed much longer recordings of the audio.

I believe this is now the case for a UP, They are out there and this has been confirmed by MB and Sandro as I asked them personally at Lavecon.

So, DESMOS is an online graphical calculator I have started adding data too.

I have annotated the picture above and you can get the live graph here..

<https://www.desmos.com/calculator/2frjvfmzug>

I have shown where the first UA was found in a convoy and the first Free-floating UA

That is Timocani and HR 1185

I have also plotted current UP location Ross 47 along with Merope and Maia

Green line is the old line for the UA. Timocani to HR 1185 was around 394 LY

So from Ross 47 to HR 1185 is 406 ly (Circa) so we are looking for a spot around 390 to 400 from Ross 47.

Search “B” class stars on the Galmap along the **RED** line. You can CLICK AND HOLD on the line in DESMOS and drag a SPOT back and forth. This will give you aprox galactic cords....

The best way to do this is Zoom in on the graph

My best guess look around -74 ,0, 322

on the Galmap filter for B CLASS ONLY

Good Luck
Commanders
